It is to the eminence of its con- | GEOLOGY. tributors that the Encyclopaedia Britannica owes its supreme A book of general information, The Rt. Hon. Sir A. C. Lyall, Late | embracing in its 40,000 articles all subjects of inquiry, the Encyclopilation, but the work of original authorities, who have themselves, those branches of knowledge with which their articles deal. The Encyclopaedia Britannica is referred to, not merely as a repository of sound information, but also as, to a great extent, an original source. It is a medium through which the world at large upon the results of his investigations—results which, in many cases, have as yet taken shape in no book. Thus, the new edition is full of information that is in advance of the times, the material of books still to be written. It is as a library of reading, of instruction, that the Encyclopaedia Britannica has become the common ground upon which distinguished specialists meet from every quarter of the world of knowledge; while, as a work of reference, it possesses this great distinction, that the inquirer who turns for information to its pages finds the comprehensive and authoritative statement of

> If the purchaser of the new Encyclopaedia Britannica possesses himself at one stroke of a library very complete as regards its subject matter, he also makes a not less notable addition to his collection of works by distinguished writers.

> Owing to the systematic preparation of its articles, as parts of one organic whole, the new Encyclopaedia Britannica is, to an extent for which previous editions afford no parallel, the work of its eminent contributors. They not only wrote for the book, they also collaborated in its creation. Their knowledge enters, not only into the articles. which they contribute, but also into the very structure and arrangement of the work.

> Paradoxical as it may sound, the learning of eminent contributors exerted the greater influence upon the preparation of the new edition because the editorial control was more effective than it had ever been in the past. The varied knowledge and experience required for the proper control of so vast an undertaking were at the editor's disposal in the shape of a large editorial staff, composed of men whose university training in various faculties fitted them to take the direction of the different departments into which the multitude of subjects could effectively be divided. This permanent staff worked together with a unanimity approaching that of a single mind, yet, through its individual members, was able to keep in constant touch with the thousand and more con-

line between editors and contributors. Plans of treatment, connected schemes for articles, were evolved and elaborated conjointly. Thus it may properly be said that the distinguished contributors to the 11th edition of the Encyclopaedia Britannica, not only wrote for the book, but worked for it. It is truly the result of collaboration.

There was, indeed, no dividing

Dr. H. A. Miers, Principal of the University of London. Dr. W. Boyd Dawkins, Hon. Professor of Geology, Manchester.

Dr. Charles Lapworth, Professor of Geology at Birmingham. Dr. Francis Bather, Assistant-Keeper of

Geology, British Museum. Dr. A. C. Spencer, Geologist to the Geological Survey of the United States. Mr. A. P. Coleman, Professor of Geology,

CHEMISTRY.

THE ORDERS RECEIVED yesterday brought the total sales to 28,059 copies.

standing, while the sloping position in which they are carried shows up the lettering on the backs, and enables the reader to identify and pick out the required volume without stooping.

An invaluable possession.

Whatever word may reasonably prompt a question as to the person, place, object or event with which it is associated, forms the title of an article in the new Encyclopaedia Britannica, varying in length from a few lines to 20, 30, 50 pages. From A to Z these articles amount to 40,000.

But while the new edition performs a valuable service in quickly yielding an answer to a specific question, the purpose of editors and contributors was by no means limited to the production of a work of reference. The book, in fact, fulfils the larger promise contained in the word encyclopaedia and affords a circle of instruction. The individual articles were written to be read, as well as for the purpose of reference. Moreover, all the articles bearing upon a given subject (zoology, for example, or architecture, or Greek history, or biblical criticism) were written so as to form together a complete and exhaustive treatment of the study in question.

In the pages of the new Encyclopaedia Britannica, therefore, the reader may pursue a subject as little or as

much as he desires, and, in purchasing the work, he adds to his equipment a complete library in a small compass. In addition to the 40,000 articles,

the 28 volumes of text (each containing about 1,000 pages) are illustrated by 400 plates, 7,000 drawings and diagrams in the text, and over 400 maps and plans. The Index (volume 29) of some 500,000 references renders every item of information contained in the 40,000 articles readily accessible to the reader.

It needed a vast machinery to be put in motion to produce "a circle of instruction" adequate to our times, and the 11th edition of the Encyclopaedia Britannica is the outcome of systematic co-operation extending over a period of seven or eight years, among some 1,500 authorities in all parts of the world. But the result of this elaborate effort is something that is very easy to use, that meets a very evident need, and must prove of constant service to every class of reader.
